AIRLIFT CONSIDERATIONS

CALCULATING FORCE CLOSURE BY AIRLIFT

USMEDCOM

IN ORDER TO ESTIMATE FORCE CLOSURE BY AIR, DETERMINATION MUST BE MADE OF RESOURCES, AIRFIELD CAPABILITIES, AND TIME FACTORS INHERENT IN AIR LIFTING A FORCE INTO THEATER.

CARGO & PAX ARE CALCULATED SEPARATELY

MOVEMENT CALCULATIONS.....

☒ **DETERMINATION OF THE TOTAL MOVEMENT
REQUIREMENT. THIS IS A DESCRIPTION OF THE UNIT
BEING
MOVED AND RESULTS IN A DETERMINATION OF THE
NUMBER OF MISSIONS REQUIRED...BOTH CARGO AND
PAX.**

**CARGO REQUIREMENT
MISSIONS**

AVG. PAYLOAD

REQUIRED

TOTAL PAX — PAX ON CARGO MISSIONS ÷ AVG. PAYLOAD = MISSIONS REQUIRED

AND THEREFORE, ONCE YOU'VE WORKED BOTH.....

CARGO MISSIONS + PAX MISSIONS = TOTAL MISSIONS REQUIRED

THEN WE GOTTA FIGURE OUT THE "CYCLE TIME."

**CALCULATING “CYCLE TIME”
FOR EACH AIRCRAFT TYPE. TO DO
THIS WE NEED SOME INFORMATION
AND CALCULATIONS:**

.....**BLOCK SPEED**
.....**ACTIVE ROUTE FLYING TIME (ARFT)**
.....**ACTIVE ROUTE GROUND TIME (ARGT)**
.....**ROUND TRIP FLYING TIME (RTFT)**
.....**ROUND TRIP GROUND TIME (RTGT)**

ARE YOU GETTING ALL THIS?????????

**ONCE THIS IS DONE, THE TONS PER DAY BY
AIRCRAFT TYPE AND THE TOTAL TONS
DELIVERED IS DETERMINED AND AIRFIELD
THROUGHPUT IS ESTIMATED.
GOT THAT?.....**

**Okay, LET'S JUST WALK THROUGH THESE CALCULATIONS
....TO SEE HOW ALL THIS HAPPENS**

**WHOEVER
THOUGHT
THIS UP IS
A SADIST!**

**CALCULATE :
A BRIGADE OF 3,500 PERSONNEL AND**

**SHORT TONS OF CARGO WILL DEPART A
CONUS APOE. THE DISTANCE TO THE**

APOD

**IS 4200 N/MILES. THE ONLY AIRCRAFT AVAILABLE IS THE
C-141.**

**45 141S HAVE BEEN APPORTIONED. THE 141s CAN CARRY
120 SOLDIERS OR 19 SHORT TONS OF CARGO AND 22
PAX. THE BLOCK SPEED IS 399 KNOTS. THE
LOAD/UNLOAD TIME FOR THE 141 IS 2 HOURS AND 15**

**.....DETERMINE CARGO REQUIREMENTS:
THIS IS CALCULATED BY THE FORMULA..**

CARGO REQUIREMENT \div **AVG. PAYLOAD** = **MISSIONS REQUIRED**

800

\div

19

=

43

HOW ABOUT PASSENGERS.....?

PAX REQUIREMENT \div **AVG. PAYLOAD** = **MISSIONS REQUIRED**

BUT.....

TOTAL PAX — **PAX ON CARGO MISSION** \div **AVG. PAYLOAD** = **MISSIONS REQUIRED**

$$\text{TOTAL PAX} - \text{PAX ON CARGO MISSION} \div \text{AVG. PAYLOAD} = \text{MISSIONS REQUIRED}$$

$$3500 \text{ PAX} - 946 \text{ PAX ON CARGO MISSION} \div 120 = \text{22 MISSIONS REQUIRED}$$

$$\text{CARGO MISSIONS} + \text{PAX MISSIONS} = \text{TOTAL MISSIONS}$$

$$43 + 22 = \text{65 TOTAL MISSIONS} \quad \checkmark$$

✓ **“ACTIVE ROUTE FLYING TIME (ARFT)” IS THE TIME FROM ORIGIN TO DESTINATION, NOT INCLUDING ANY GROUND**

THIS IS CALCULATED BY THE FORMULA..

$$\text{DISTANCE} \div \text{BLOCK SPEED} = \text{“ARFT”}$$

NOTE: “BLOCK SPEED” IS DETERMINED FROM USAF TABLE GIVING AVERAGE SPEEDS.... OVER SPECIFIED DISTANCES BY AIRCRAFT TYPE

$$4200 \div 399 = \underline{10.52}$$

(IF THERE ARE MULTIPLE LEGS, THEY WILL BE CALCULATED AND ADDED TOGETHER)

✓ **“ACTIVE ROUTE GROUND TIME (ARGT)” IS THE CUMULATIVE
GROUND TIME OF ALL THE INTERMEDIATE STOPS**

HOW MANY INTERMEDIATE STOPS WERE REQUIRED?

NONE! ...

**BUT IF THERE HAD BEEN, THEY WOULD HAVE BEEN
ADDED TOGETHER TO GIVE THE “ARGT.”**

WHEN “ACTIVE ROUTE FLYING TIME (ARFT)”
IS ADDED TO “ACTIVE ROUTE GROUND TIME (ARGT)”
THE RESULT IS

“TIME TO ARRIVAL” ..THE TIME REQUIRED FOR CARGO AND
PASSENGERS TO ARRIVE AT THE DESTINATION, INCLUDING
ALL ENROUTE GROUND TIME

OKay, LET'S LOOK AT DETERMINING "CYCLE TIME"

"ROUND TRIP FLYING TIME (RTFT)"

"ROUND TRIP GROUND TIME (RTGT)"

"CYCLE TIME" ✓

RTFT?

**ROUND TRIP FLYING TIME, “RTFT” IS THE
ACCUMULATED FLIGHT TIME FROM START PO
TO THE DISCHARGE SITE AND BACK TO THE
POINT OF ORIGIN.**

**WAIT! “RTFT”
WHAT THE HECK
IS THAT?**

**IN OUR EXAMPLE, WE HAD A
“NON-STOP” LEG OF 4200 MILES.
IN THIS CASE, OUR “ARFT” IS
DIVIDED BY THE “BLOCK SPEED”
AND DOUBLED TO GET THE “RTFT.”**

RTFT = 21.06 HOURS

**WHAT IF THERE WERE MULTIPLE
ENROUTE STOPS?**

ROUND TRIP GROUND TIME, “RTGT,” IS THE ACCUMULATED GROUND TIME FROM START POINT TO DISCHARGE SITE AND BACK TO THE POINT OF ORIGIN.

WHAT WAS THE “ARGT” FOR OUR EXAMPLE?

IN THE EXAMPLE THEN, WE WILL NEED THE ORIGIN, DESTINATION, AND RETURN DESTINATION GROUND TIMES TO CALCULATE THE RTGT. WHAT IS THE GROUND TIME FOR THE 141s?

GROUND TIME 2 HRS AND 15 MIN EACH

RTGT 4 HRS AND 30 MIN

NOW WE CAN DETERMINE THE CYCLE TIME!

FORMULA:

$$\text{CYCLE TIME} = \text{RTFT} + \text{RTGT}$$

WHAT IS THE RTFT? 21.06 HOURS

WHAT IS THE RTGT? 6.75 HOURS

WHAT IS THE CYCLE TIME? 27.81 HOURS

Okay DETERMINING “CLOSURE” IS NEXT

HANG ONWE'RE ALMOST THERE!!! DEFINE CLOSURE??

“THE PROCESS OF A UNIT ARRIVING AT SPECIFIED LOCATION

**IT BEGINS WITH THE FIRST ELEMENT ARRIVING AT THE APOD
THROUGH INTERMEDIATE STOPS, TO THE APOD. IT CONCLUDES
WITH THE LAST ELEMENT ARRIVES AT THE APOD.**

Okay ...
WHATS THE FORMULA
FOR “CLOSURE?”

“CLOSURE” =

REQUIREMENTS ~~X~~

RTFT ~~÷~~

AVG PAYLOAD ~~X~~

OF AIRCRAFT ~~X~~

“USE” RATE

OR....

CLOSURE = REQUIREMENT X RTFT

AVG. PAYLOAD X AIRCRAFT X USE ~~X~~ ~~?~~ ~~?~~

**BUT, WAIT!WHY ARE WE USING RTFT? WHY
“ARRIVAL TIME”?WHY NOT “CYCLE TIME” OR
.....WHY NOT SOMETHING ELSE?
DOES THE “USE” RATE FACTOR THAT IN**

YUP....IT DOES

$$\text{CLOSURE} = \frac{\text{REQUIREMENT} \times \text{RTFT}}{\text{AVG. PAYLOAD} \times \text{AIRCRAFT} \times \text{USE}}$$

BUT HERE'S ANOTHER QUESTION
WHAT IF THIS IS A BIG OPERATION AND
WE ARE “**SURGING**” THE THEATER???
WHAT CHANGE IS MADE IN THE
PLANNING FORMULA?

LET'S LAY OUT THE INFO.....

TOTAL MOVEMENT REQUIREMENT	800=ST CARGO
	=3500 PERSONNEL
DISTANCE	=4200 MILES
AIRCRAFT	=45 C-141s
PAYLOAD	=120 SOLDIERS or 19 ST + 22 PAX
BLOCK SPEED	= 399
LOAD (UNLOAD) TIME	KT RS 15 MIN
RTFT	= 21.06 HOURS
USE RATE	= 7.4

**OKay LET'S SEE IF
WE CAN PUT IT TOGETHER**

$$\begin{array}{rcl}
 \text{CLOSURE} & = & \frac{800 \quad T \quad X \quad 21.06 \quad T}{19 \text{ SHORT TONS} \quad \rangle \quad 45 \quad \text{「} \text{「} \quad 7.4 \quad \text{「} E}
 \end{array}$$

“CLOSURE”

FOR OUR EXAMPLE:

FOR CARGO:

$$\text{CLOSURE} = \frac{800 \times 21.06}{19 \times 45 \times 7.4}$$

CLOSURE = 2.66 DAYS

Okay HOW MANY PAX ON THESE
FLIGHTS? FIGURE MAX ON AVAILABILITY.

HOW MANY MORE MUST BE ACCOUNTED FOR?

NOW, WORK OUT CLOSURE FOR PAX

FOR PASSENGERS:

$$\text{CLOSURE} = \frac{? \times 21.06}{120 \times 45 \times 7.4}$$

HOW MANY PAX WERE ON THE CARGO FLIGHTS? 990

HOW MANY MORE MUST BE FLOWN 2510

$$\text{CLOSURE} = \frac{2510 \times 21.06}{120 \times 45 \times 7.4}$$

CLOSURE = **1.32 DAYS**

**ADDING 'EM TOGETHER GIVES THE
TOTAL CLOSURE ESTIMATE... OR**

**OKay, NOW FOR GRINS LET'S FIGURE
..... FLEET CAPABILITY.....**

$$\frac{\text{AVG. PAYLOAD} \times \text{AIRCRAFT} \times \text{USE}}{\text{RTFT}} = \underline{\text{FLEET CAPABILITY}}$$

**SO WHAT IS THE
FLEET CAPABILITY?**

**NOW ...LET'S WORK ON
AIRFIELD THROUGHPUT CAPABILITY**

USMEDCOM

AIRFIELD **THROUGHPUT** **CAPABILITY**

CAPABILITIES FOR ALL AIRFIELDS IN THE DEPLOYMENT MUST BE ASSESSED. IN PLANNING, ENROUTE FIELDS ARE ASSUMED TO HAVE HIGHER THROUGHPUT THAN ONLOAD/OFFLOAD LOCATION

REMEMBER “MOG?” ...ALTHOUGH THAT LITERALLY MEANS “PARKING SPACE” ...THE REAL FACTOR IS CALLED “WORKING MOG”

AIRFIELD THROUGHPUT CAPABILITY...

IT IS NECESSARY TO LOOK AT AIRFIELD
THROUGHPUT CAPABILITY TO SEE IF A FIELD
WILL LIMIT AN OPERATION.

THIS IS THE FORMULA THAT IS USED TO DETERMINE AN
AIRFIELD'S THROUGHPUT CAPABILITY

$$\frac{\text{MOG} \times \text{AVERAGE PAYLOAD} \times \text{OP'N HOURS}}{\text{GROUND TIME}} \times \text{"QUEUING EFFICIENCY"}$$

HERE'AS A PROBLEM:

DO THROUGHPUT CAPABILITY
CALCULATIONS
FOR A 24 HOUR AIRPORT THAT HAS A
WORKING
MOG OF ONE 141 AIRCRAFT, AND A 85%
QUEUING EFFICIENCY

$$\frac{1 \times 19 \times 24 \times 85\%}{2.25 \times 1E}$$

AIRFIELD THROUGHPUT CAPABILITY...

USMEDCOM
